

University Research Grants

for Academic Year 2015-2016

RESEARCH GRANTS

Full-time members of engineering faculties of Canadian universities are invited to apply for research grants offered by the Canadian Institute of Steel Construction. Grants are awarded for research during the 2015 - 2016 academic year on subjects judged to be of value in advancing the use of steel in construction. Grants to a total value of approximately \$100,000 will be announced by June 1, 2015. Each grant is awarded for a one year period. Grants are awarded at the discretion of the CISC University Research Committee on the merits of the applications received. In addition, the principal researcher of the highest ranked proposal will receive the H. A. Krentz Research Award and a gift of \$5,000. The recipient will be invited to accept the Award at the CISC Annual Meeting in San Francisco, California on September 25, 2015 as a guest of CISC.

Applications shall be received no later than April 1, 2015 and should be submitted electronically in PDF format to:

Maura Lecce, Ph.D., Research Grant Manager
Canadian Institute of Steel Construction
mlecce@cisc-icca.ca.

Late submissions will not be accepted.

Descriptions of some suggested research topics and conditions pertaining to the award of grants are given herewith.

SOME SUGGESTED TOPICS FOR 2015 - 2016 UNIVERSITY RESEARCH (NOT PRIORITIZED)

Applications for topics not listed are also encouraged. All applications will receive equal consideration, including applications for support of projects not on the list. *More than one research proposal may be suggested by some of the listed topics.*

- 1) CONNECTIONS SUBJECT TO COMBINED SHEAR AND TENSION
Design guidelines, verified by experimental testing, are needed in CSA S16 for calculating the tension resistance of various connections with realistic levels of shear load. This work would consolidate and build on experimental results from past Canadian and US research programs.
- 2) DESIGN METHOD FOR OVERHANGING CANTILEVERED BEAMS
Research is required to develop a practical and simplified method for calculating the strength of cantilevered overhanging beams which are partially loaded on the top flange and at the shear center.
- 3) SHORT SPAN STEEL BRIDGE STANDARD DESIGNS
Work is required to develop standard designs for rolled beam and plate girder bridge solutions for spans up to 50 m.
- 4) SFRSs FOR REGIONS OF LOW AND MODERATE SEISMICITY
There is an ongoing need for innovative Seismic Force Resisting Systems that will keep steel competitive with all other framing materials in regions of low and moderate seismicity. Consideration should be given to simplified design rules, fabrication requirements, handling and erection.
- 5) REINFORCED BEAMS
Designers are asking for guidance on predicting the resistance and deflection of reinforced beams (reinforced with cover plates or other steel). The effects of reinforcing beams while under load and effects of welding on the strength of the member should be considered. Also, the evaluation of the strength and serviceability performance of wide flange beams reinforced on one-side only (for example with angle or plate) is required.
- 6) EMBEDDED STEEL BRACKETS FOR CLADDING CONNECTIONS
Work is needed to develop practical and cost effective connections for cladding in steel framed buildings. Of greatest interest are solutions involving steel brackets embedded into the perimeter of the concrete slab. Provide design and detailing guidelines, verified by experimental testing, for such connections.
- 7) HSS JOINT WELDING
There is increasing demand to provide economical and technically adequate joint configurations for HSS trusses which minimize joint preparation. Research is required to explore the viability of using a single weld between HSS branch members of K and N gap connections.
- 8) ELIMINATING GUSSET PLATES IN TRUSS CONNECTIONS
Research is needed to develop and assess alternatives to gusset plate connections in trusses. The alternative connection methods should be economical and easy to fabricate.
- 9) SEISMIC DESIGN OF STEEL DECK DIAPHRAGMS
Research is required to assess the inelastic/post-event behaviour of steel deck diaphragms and to develop design guidelines.

10) BOLTS THROUGH THERMAL BREAKS

Often times, when steel members penetrate the exterior of a building, a spacer such as a neoprene pad is used to reduce thermal bridging and a bolted connection is used through the joint. Research is required to determine the effect of the thermal break spacer on the shear capacity of the bolts.

11) ECONOMICAL INNOVATIVE STEEL LOW-FLOOR SOLUTIONS

Research is required to develop innovative steel floor solutions which would allow two-way systems and minimize floor height. Consideration should be given to constructability and fabrication requirements.

CONDITIONS PERTAINING TO AWARD OF CISC RESEARCH GRANTS

1. Funds will be paid to the University, to be held in trust. Unless otherwise agreed upon, payment will be made in equal quarterly installments commencing September 15, 2015. The 2nd, 3rd and 4th payments will be made upon receipt of the progress report from the previous quarter (see Item 4). **No payments will be made after April 30, 2017.** It is assumed that a portion of the grant normally will be used for a research fellowship for a post-graduate student and, as such, the CISC does not entertain inclusion of overhead charges in applications for Research Grants.
2. Acceptance of an award constitutes an agreement to undertake and complete the research project described in the application. Unless otherwise agreed upon, the CISC is not obliged to provide supplementary funds nor to donate material and/or supply equipment.
3. The University Research Committee of the CISC shall appoint a Project Coordinator for each project to provide liaison between the Project Director (applicant) and the Committee and to assist the Project Director when necessary.
4. During the course of the work, the CISC shall be provided with progress reports in PDF format covering the first, second and third quarters of the period in which the research is underway. Progress reports normally will be submitted December 15, March 15 and May 15. It is expected that the first progress report will include an evaluation of the existing literature. The progress report shall be sent to the Research Grant Manager of the CISC.
5. Upon completion of the work, the CISC shall be provided with a final detailed report in PDF format. In cooperation with the Project Director (applicant), the final detailed report or contents thereof may be used for CISC publication purposes (eg., CISC web site, Advantage Steel magazine). The detailed report shall be sent to the Research Grant Manager of the CISC.
6. Where a computer program is developed as a major part of a CISC-sponsored project; the CISC shall be supplied a copy of the source code and any resource files or libraries necessary to compile and link the program. The CISC shall also be supplied with sufficient documentation to allow easy use of the program including a sample problem with printed output. The program source code must contain fully identified data structures, variables, functions and logic.
7. Grants are awarded for a period of one year only. Award of grants in succeeding years for additional phases of projects will be subject to approval each year. Projects intended as one phase of a larger project extending over a period of more than one year shall be so identified in the application.
8. The Project Director (applicant) may prepare a paper, or papers, based on his research and submit same for publication in an appropriate engineering journal (e.g. Canadian Journal of Civil Engineering) or equivalent publication. Should a paper not be prepared within six months of receipt of the final report, the CISC may, at its option, request the recipient to prepare a paper suitable for publication.
9. The following information shall be included in the application (max. 4 pages preferred):
 - * Name of Applicant (Project Director).
 - * Name of university and relevant faculty, department, etc.
 - * Position of applicant.
 - * Qualifications of applicant, including brief outline of any research currently in progress or recently completed.
 - * Title, Scope and Objectives of proposed research project.
 - * Description of how the proposed research advances the use of steel in construction and the potential benefits to the steel industry.
 - * Brief description of general procedure to be followed, including personnel, equipment, specimens, etc., likely to be required.
 - * Proposed time schedule.
 - * Funds to be provided by other sponsors, if any. In particular, applicants are encouraged to indicate how the CISC Research Grant and possible in-kind Contributions provided by others in the steel industry might be used to partner additional funding from federal or provincial granting agencies.
 - * Amount of money requested, with a brief statement of anticipated disbursements.
 - * A statement signifying that the conditions pertaining to award of CISC research grants (as stated herein) are acceptable to the applicant.
